POWER FLUSHING

For Schools, Commercial and Industrial Buildings.

Power flushing is critical to maintain the efficiency and longevity of heating systems and is the most effective way to clean and protect systems. With specialist high performance cleaning equipment, we are able to flush away static system sludge and corrosion debris which can significantly diminish the efficiency and performance of the heating system.

For large buildings, where heating systems are extensive and heavily relied upon, we offer a comprehensive "cleaning-in-place" service, including fan coil units and boilers. This ensures that these large-scale systems operate at their optimal capacity, providing consistent heating without the increased costs and potential breakdowns associated with system neglect.

THE BENEFITS TO POWER FLUSHING THE HEATING SYSTEM

Improved Heating Efficiency

Power flushing can significantly improve the efficiency of heating systems by cleaning out all the sludge, rust and debris out of the heating system, allowing the pumps and boiler system to circulate the hot water without resistance.

Extended System Life

Power flushing the heating system means that the pumps and boilers don't have to work so hard to circulate the hot water around. This prolongs the life of the components and avoids breakdowns which is crucial for large buildings.

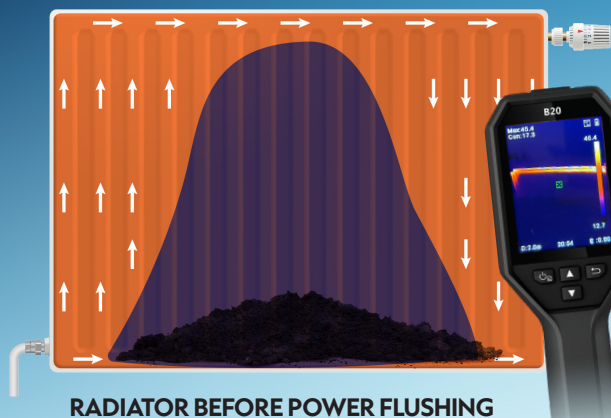

Cost Savings

By cleaning out the heating system, radiators heat up quicker and maintain the correct temperature. This reduces energy bills and avoids expensive repairs

HOW DOES POWER FLUSHING WORK?

 Cold Area  Heated Area  Sludge

RADIATOR BEFORE POWER FLUSHING

RADIATOR AFTER POWER FLUSHING

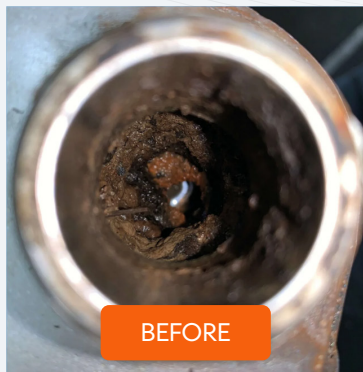

Firstly, your heating system is drained of all water. A biodegradable cleaning agent is then pumped into the heating system by using a descaling pump. This chemical descaling pump pushes the cleaning agent around the heating system at high pressure, dislodging the debris and limescale and cleaning all the pipes and radiators getting rid of the debris and limescale that builds up in your heating system over time.

At TMG Plumbing and Heating Services, we also use an extra magnetic filtering system which removes all metal oxide particles in the heating system that can cause pin holes in radiators and damage to the boiler. The heating system is then refilled with an inhibitor which helps to prevent further build-up in the future and rebalanced so the system is running efficiently.

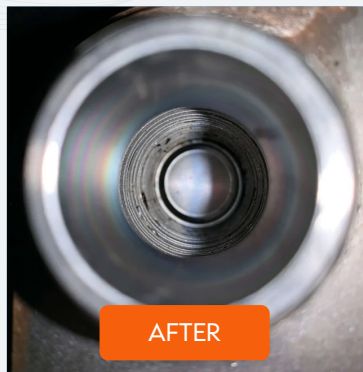

Check out our short video showing our power flushing equipment in action.

OUR PROCESS

BEFORE

AFTER

Initial Assessment

We will come and do an initial assessment of your premises to understand the specific needs of the building and provide you with a comprehensive quote for the work needed. By use of a thermal imaging camera, we can show which areas of the heating system need attention.

Use of Advanced Equipment

By use of thermal imaging cameras, air compressors, specialist flush pumps and specific chemicals, all pipework and heating appliances such as radiators, boilers and fan coil units are cleaned and flushed.

Minimal Disruption

Our service is a C.I.P. (Cleaning-In-Place) service and is designed to cause minimal disruption to your business, which is especially important in schools and operational industrial buildings.

We also offer an added service to demineralise the water that fills the heating system. This filters out the minerals, salts and gases that contribute to the ongoing build-up of sludge, limescale and rust in water-filled systems.

To get a custom quote please **Contact us at TMG Plumbing & Heating Services** on our contact form and we can schedule a site visit and service.
