

MAXIMUM RESULTS WITH MINIMAL DISRUPTION

Radiators and underfloor heating build up sludge, dirt and limescale over time which blocks the flow of hot water to these systems, making them inefficient and causes corrosion. CIP (Cleaning In Place) works with minimal disruption while preventing further blockages and build up, future proofing your heating system.

OUR PROCESS

Improved Heating Efficiency

We'll conduct an initial assessment to understand your home's needs and provide a detailed quote. Utilizing a thermal imaging camera, we'll identify areas in your heating system requiring attention.

Use of Advanced Equipment

We employ cutting-edge thermal imaging cameras, air compressors, high-power flush pumps, and specialized chemicals. This equipment thoroughly cleans and flushes all pipework and heating appliances, including radiators, boilers, and underfloor heating systems.

Minimal Disruption

Our service is designed to cause minimal disruption to your home and usually only takes a day to fully complete.

THE BENEFITS TO POWER FLUSHING

Improved Heating Efficiency

Power flushing enhances heating system efficiency by removing sludge, rust, and debris, enabling hot water circulation through pumps and boilers without resistance.

Extended System Life

Power flushing reduces strain on heating components, enhancing efficiency and prolonging their lifespan. This is crucial for large buildings to prevent breakdowns.

Cost Savings

Cleaning the heating system ensures quicker heating and temperature maintenance. This in turn will reduce your energy costs and prevents costly repairs.

HOW DOES IT WORK?

First, the heating system undergoes a complete water drainage. Following that, a specialised cleaning chemical is introduced into the system using a power flushing machine.

This machine vigorously circulates the cleaning agent throughout the heating system, effectively dislodging any accumulated sludge and thoroughly cleansing the pipes and radiators.

At TMG Plumbing and Heating Services, we employ an additional filtration system which targets and eliminates metal oxide particles from the heating system. These particles are known to cause damage to radiators and boilers by creating pinholes.

Finally, the heating system is replenished with an inhibitor to prevent future build-up, ensuring its optimal performance.
